## **Outline**

- Introduction
- PQPF and Verification Methods
- Verification Results
- Future Works
- Summary

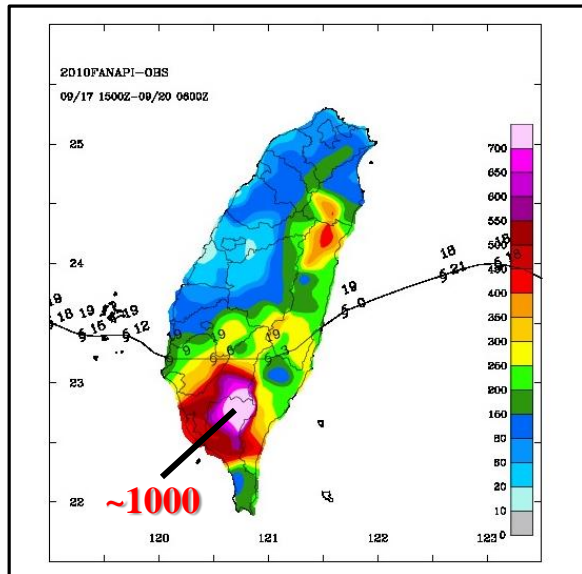

***Date : 2015.09.17***

# Introduction

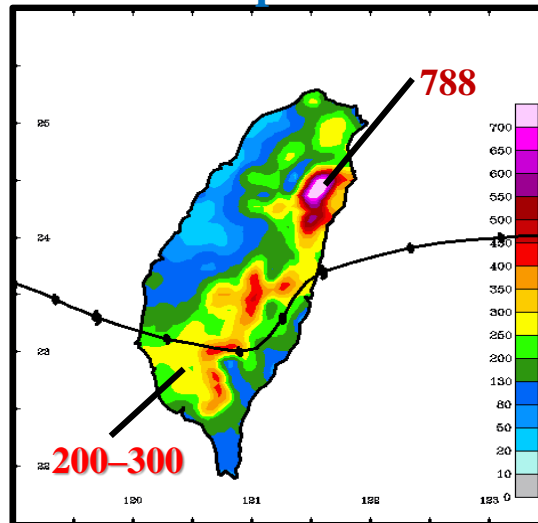

- A **typhoon rainfall climatology model** and **some deterministic forecasting models** (MM5, WRF) were developed and used many years ago.
- Although the topographical lifting of typhoon circulation (topography-locking effect) could be mainly controlled by the climatology model or single deterministic model, they might fail to provide reasonable rainfall estimates for typhoons with special convective features.

## Fannapi (2010)

### Observation

### Model output

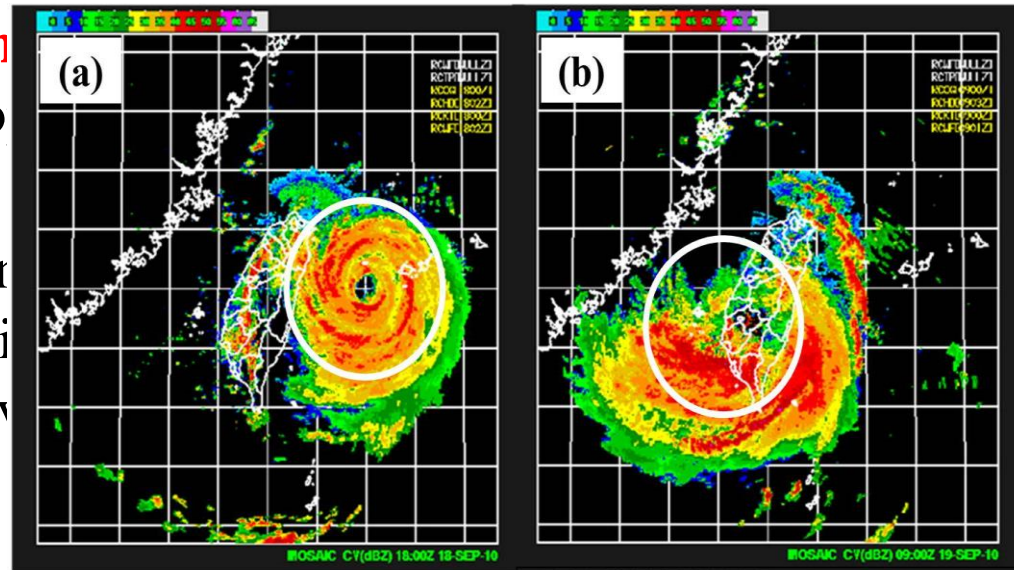

**Inner rainband re-organized after the typhoon center moved across the mountain range causing serious flooding in Kaohsiung area.**

(Lee et al., 2006; 2013)

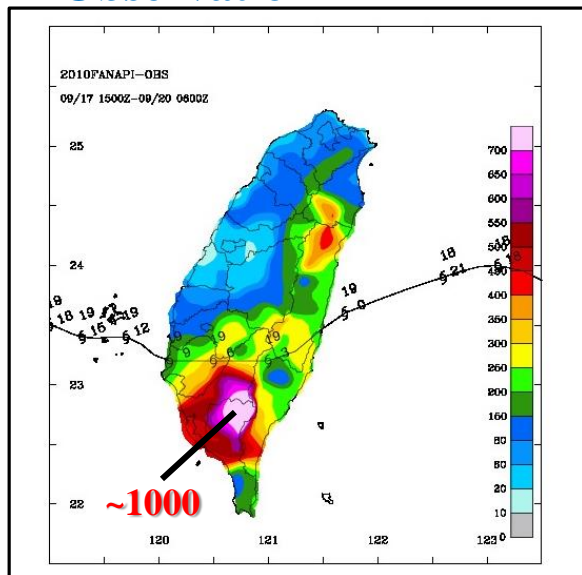

# Introduction

- A **typhoon rainfall climatology models** (MM5, WRF) were developed
- Although the topographical lifting (locking effect) could be mainly considered in a deterministic model, they might fail for typhoons with special convective

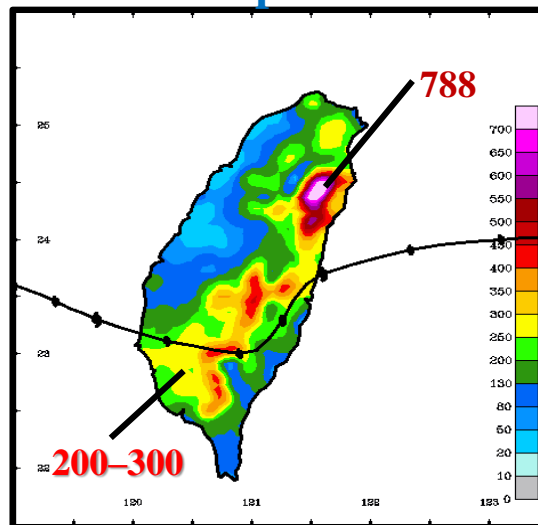

**Fannapi (2010)**

## Observation

## Model output

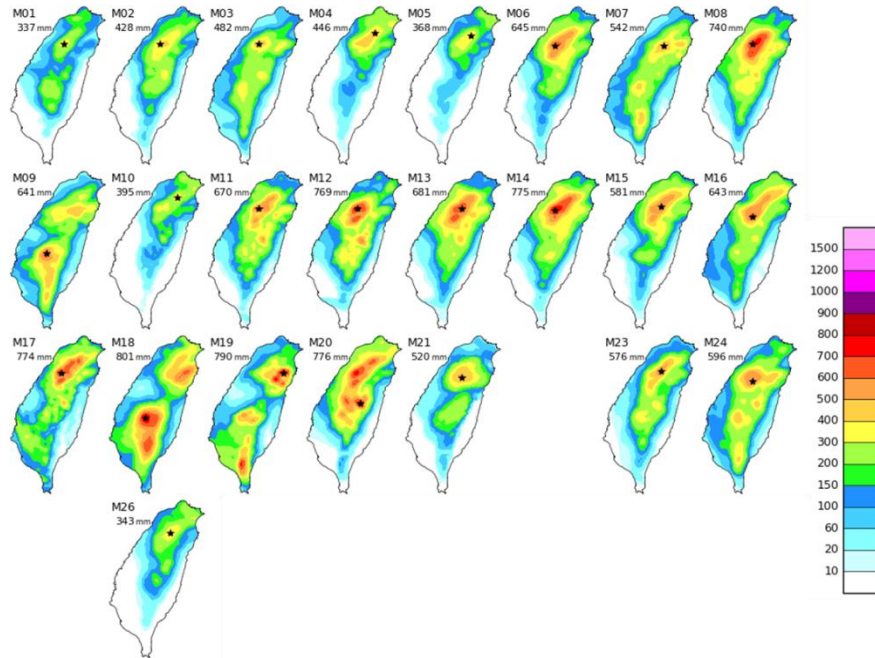

**Inner rainband re-organized after the typhoon center moved across the mountain range causing serious flooding in Kaohsiung area.**

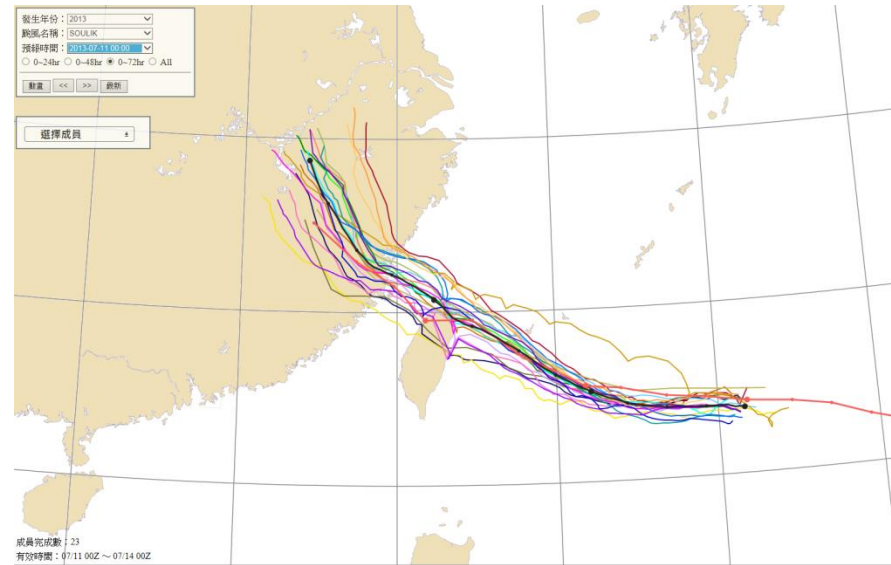

(Lee et al., 2006; 2013)

# Ensemble mean

24 hr accumulated rainfall

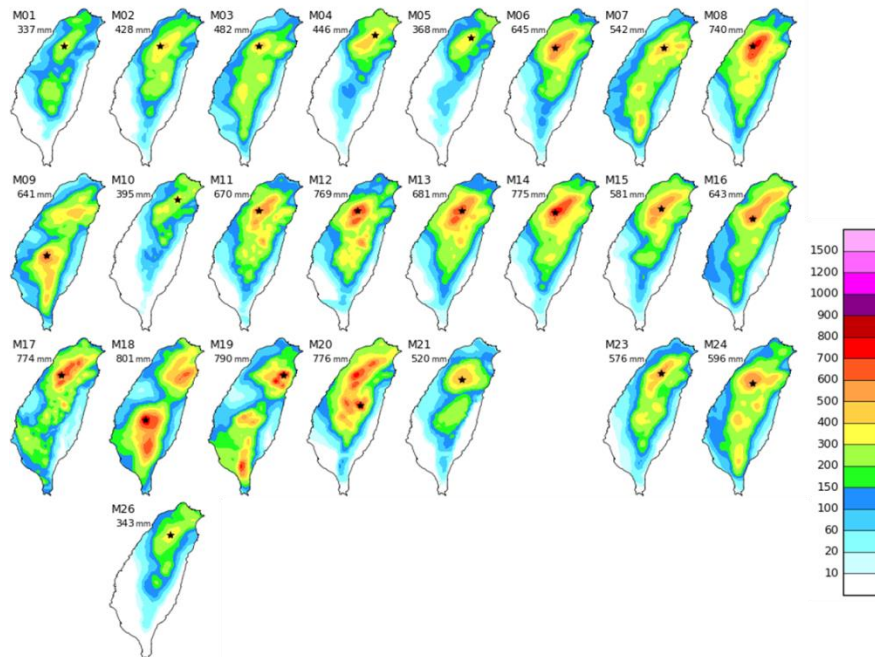

2013 typhoon Soulik  
Initial time : 2013071100Z

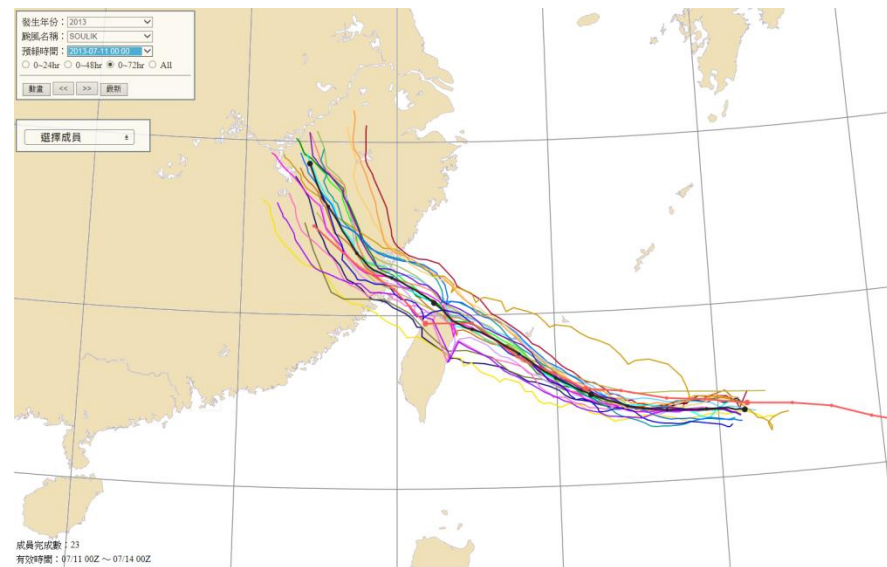

# Ensemble mean

24 hr accumulated rainfall

2013 typhoon Soulik  
Initial time : 2013071100Z

## Probability Forecast?

- Ensemble mean can not show the uncertainty
- To quantify the uncertainty of the ensemble precipitation forecast, the probabilistic quantitative precipitation forecast (PQPF) is developed.

# Probabilistic Quantitative Precipitation Forecast

24 hr accumulated rainfall

2013 typhoon Soulik  
Initial time : 2013071100Z

$\geq 10\text{mm}$

$\geq 25\text{mm}$

$\geq 50\text{mm}$

$\geq 130\text{mm}$

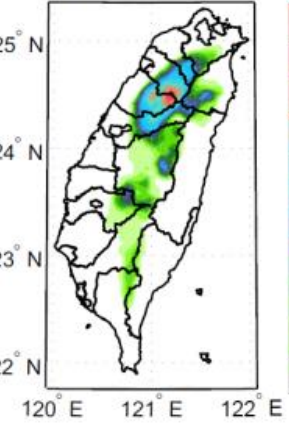

$\geq 200\text{mm}$

$\geq 350\text{mm}$

## Observation

## PQPF

# Verification

- **Reliability diagram (RD)**

- plots the observed frequency against the forecast probability

- **Relative operating characteristic (RC)**

- plots hit rate and false alarm rate
- RC area  $\geq 0.7$  : well skill

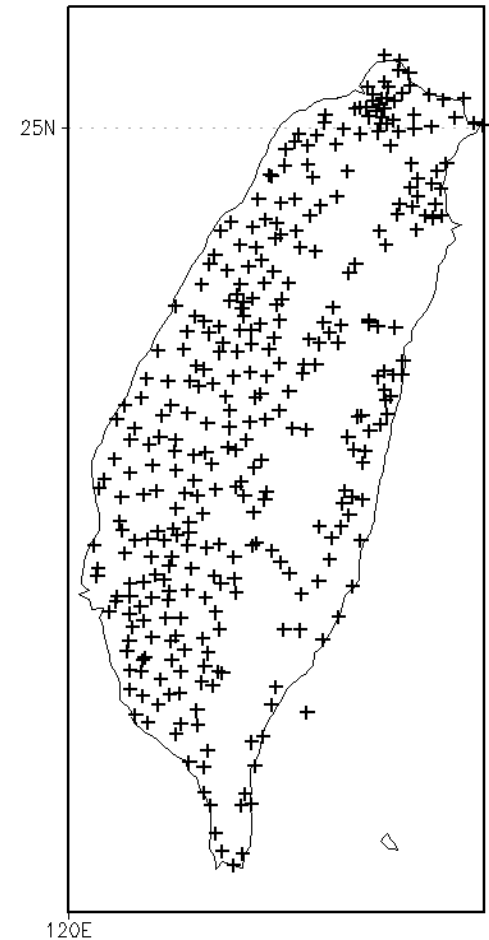

- **Brier score (BrS)**

- Measures the mean squared probability error
- $$BrS = \frac{1}{n} \sum_{j=1}^n (p_j - o_j)^2$$

- **Rank probability score (RPS)**

- Measures the sum of squared differences in cumulative probability space for a multi-category probabilistic forecast
- $$RPS = \frac{1}{M-1} \sum_{m=1}^M \left( \sum_{j=1}^m p_f(j) - \sum_{j=1}^m p_o(j) \right)^2$$

Interpolate ENS values  
to 499 raingauge station

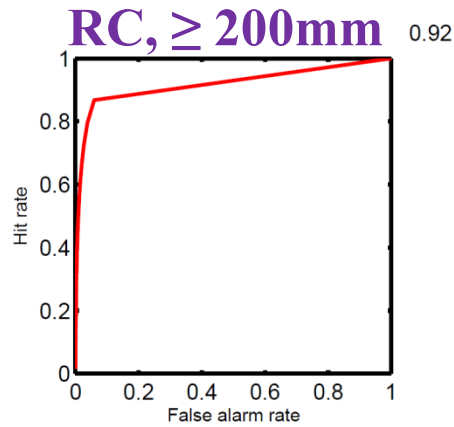

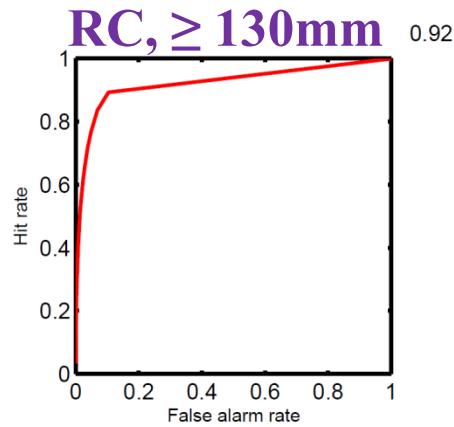

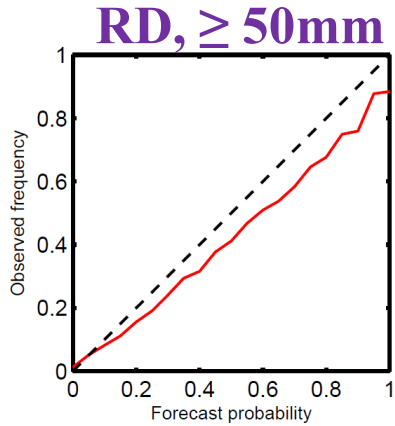

# Verification Results

- Targets of analysis
  - Different tracks of typhoon
  - Different sizes of typhoon
  - Specific regions in specific period
  - Different years
  - Different intensities of typhoon
  - Different motion speeds of typhoon
- The results of verification are significantly affected by the track and size of typhoon.

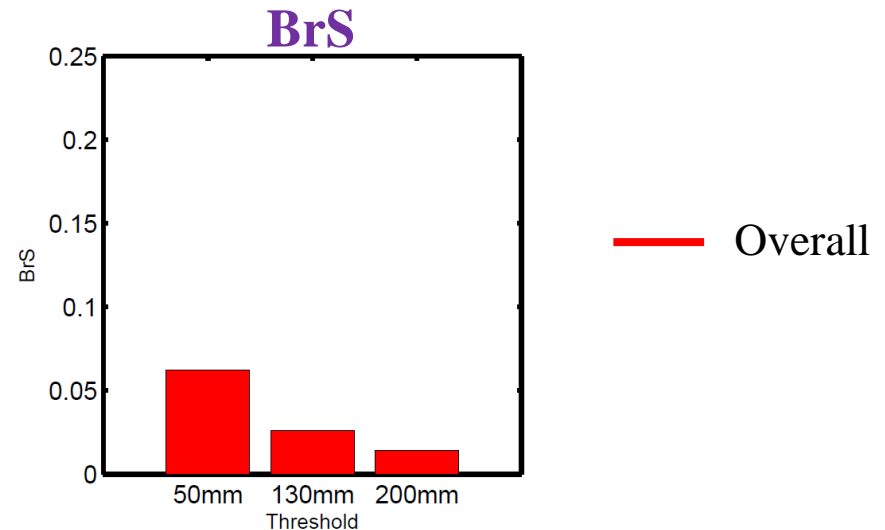

Year	Name	Track
2014	FUNG-WONG	---
2014	MATMO	W
2014	HAGIBIS	---
2013	FITOW	W
2013	USAGI	W
2013	KONG-REY	N
2013	TRAMI	W
2013	CIMARON	---
2013	SOULIK	W
2012	JELAWAT	---
2012	TEMBIN	---
2012	KAI-TAK	---
2012	HAIKUI	---
2012	SAOLA	W
2012	DOKSURI	---
2012	TALIM	N
2011	NANMADOL	W
2011	MUIFA	---
2011	MEARI	---
2011	SONGDA	---

# Verification Results

- Overall, 2011-2014
- Rainfall in 24 hr
- Perform well (?!)
  - RD : overestimate for high probability value
  - RC area  $> 0.7$
  - BrS : small

# Verification Results

- Analysis of **different typhoon tracks**
  - Westward : track 1-5 in CWB
  - Northward : track 6-9 in CWB
- The performance for the westward typhoon is better than the northward typhoon, because the track uncertainty of the northward typhoon is more significant.

# Verification Results

- Analysis of **different typhoon sizes**
  - Large : radius of 15 m/s  $\geq 200\text{km}$
  - Small : radius of 15 m/s  $< 200\text{km}$
- The performance for the large typhoons is better than the small typhoons, because the effect of the track error will be emphasized in the small typhoons.

**RD,  $\geq 50\text{mm}$**

**RC,  $\geq 50\text{mm}$**  0.93, 0.88

**RD,  $\geq 130\text{mm}$**

**RC,  $\geq 130\text{mm}$**  0.95, 0.90

**RD,  $\geq 200\text{mm}$**

**RC,  $\geq 200\text{mm}$**  0.95, 0.90

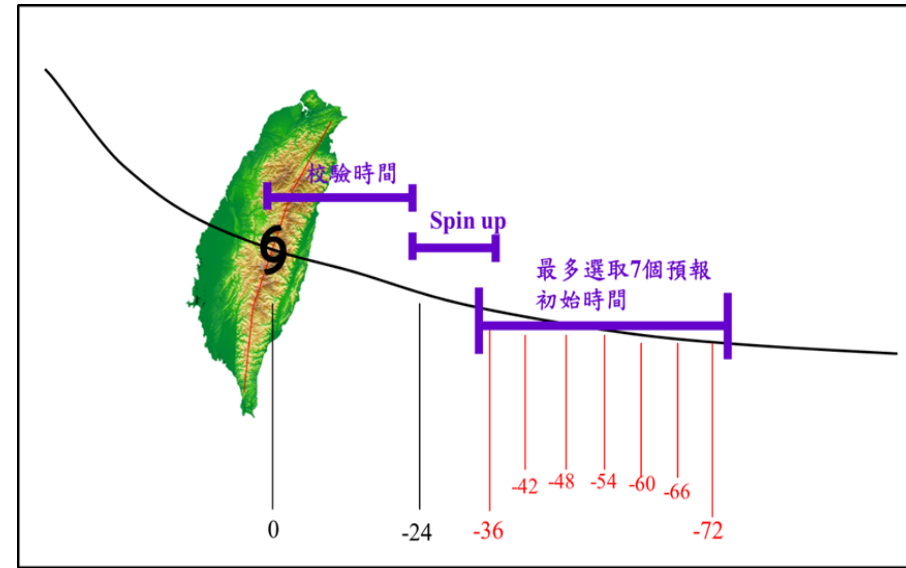

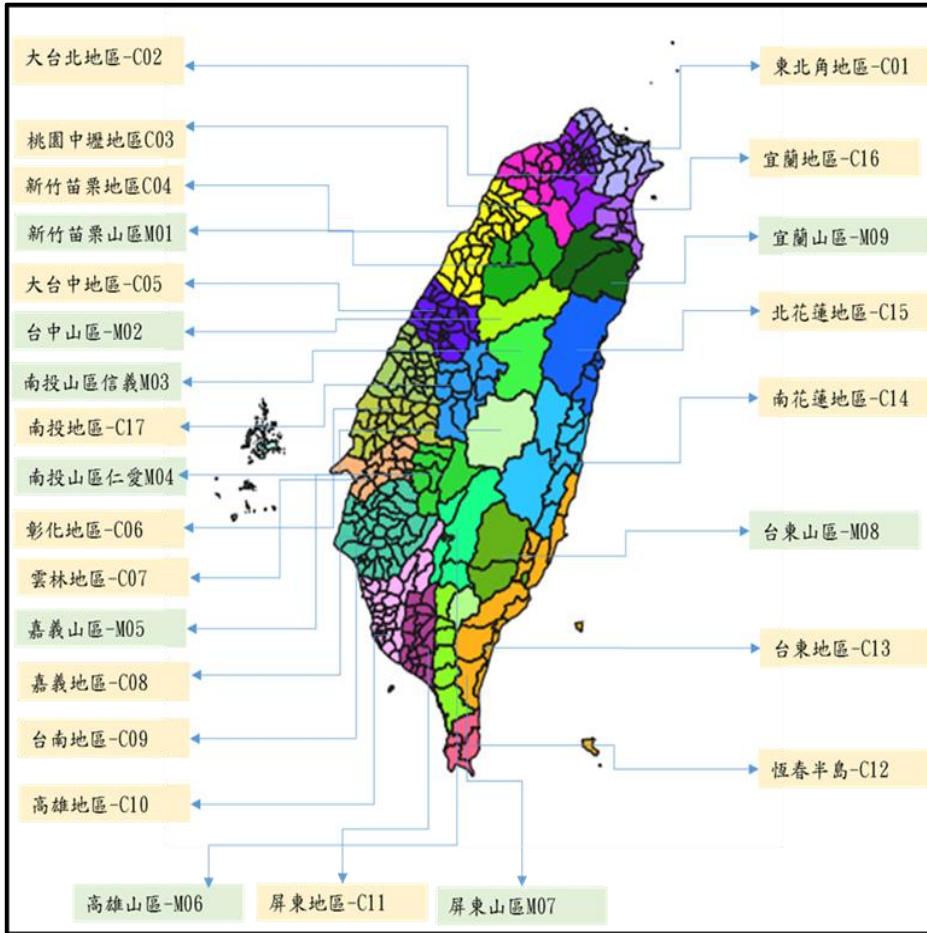

**BrS**

# Verification Results

依地形、行政區將臺灣地區分為17個平地校驗區、9個山地校驗區，共26個校驗區。

# Verification Results

- Analyze the difference between the **city and mountain regions** during the major affecting period.
- Both are overestimated for high probability value in high rainfall threshold.

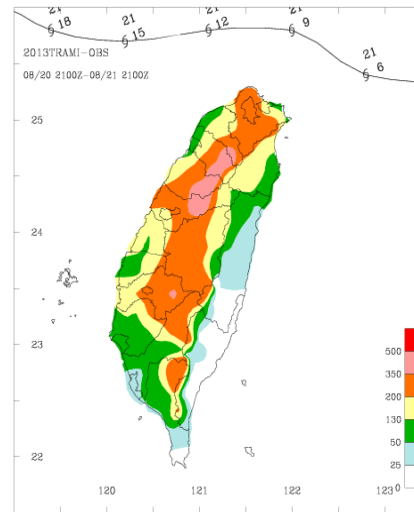

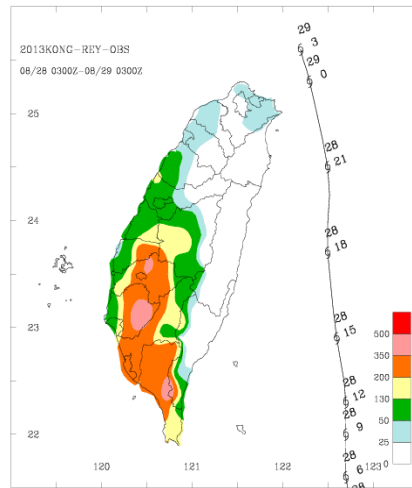

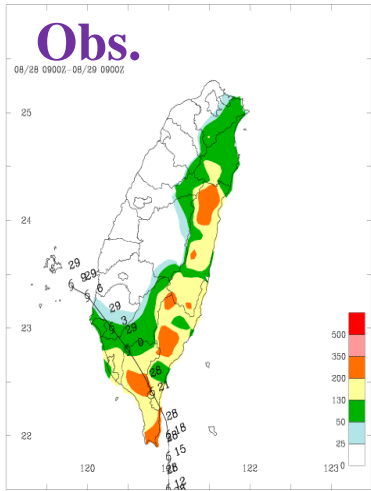

# Remote Rainfall

2011 Nanmadol

2013 Kong-rey

2013 Trami

- **Remote rainfall** in the event of the typhoon tends to be **significantly underestimated** in this ensemble system.

**RPS** (DOL -12~12 h)

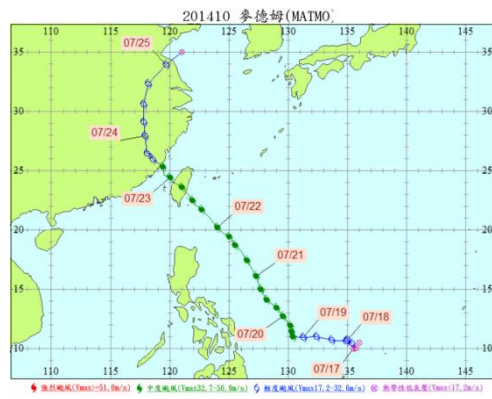

2013 KONG-REY -12~12 h

2013 TRAMI -12~12 h

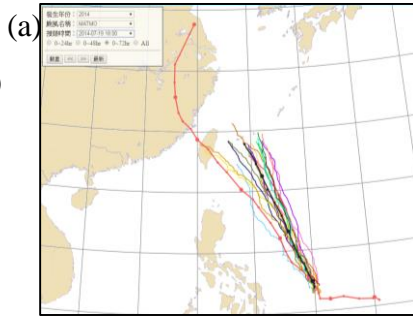

# Matmo (2014)

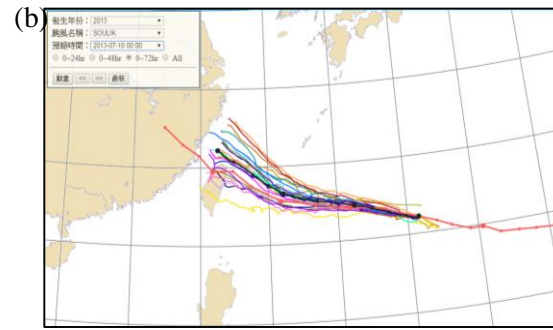

# Soulik (2013)

前期  
(-24~0)

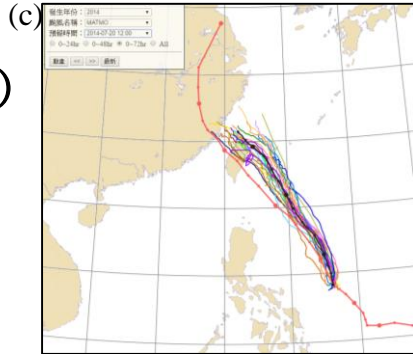

RPS

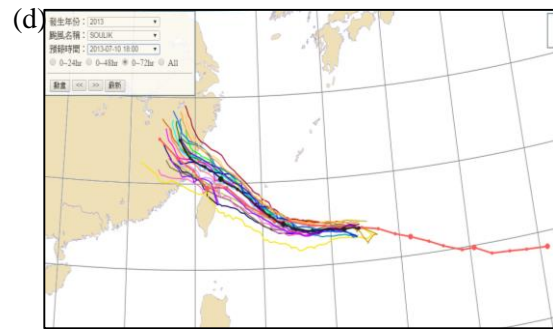

RPS

中期  
(-12~12)

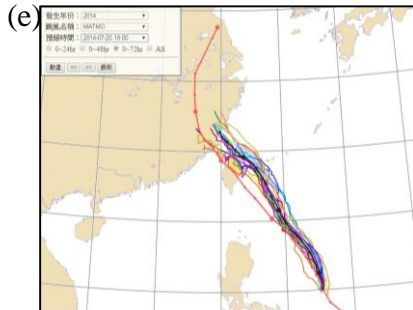

2014 MATMO -12~12 h

2013 SOULIK -12~12 h

後期  
(0~24)

2014 MATMO 0~24 h

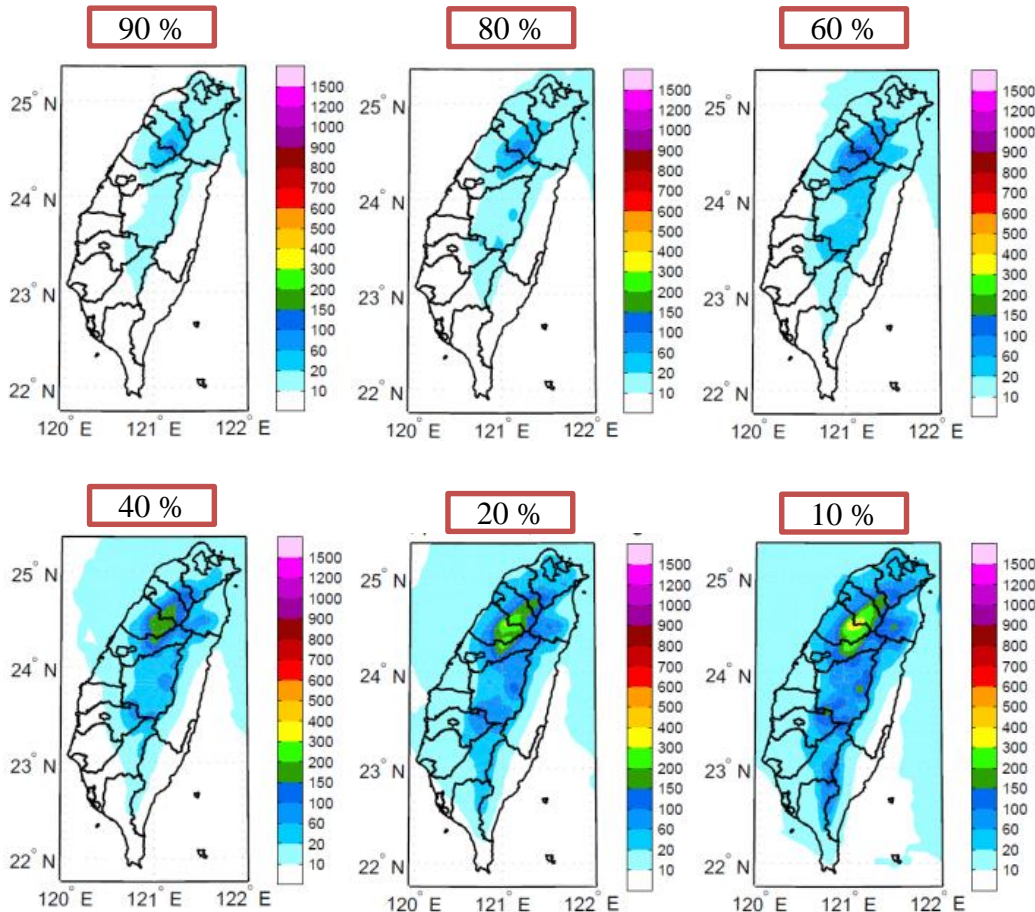

2013 SOULIK 0~24 h

# Quantitative Precipitation Forecasts Probability (QPFP) based on Typhoon Track

ETQPF (Hong et al.,2015)

2013 typhoon Soulik, Initial time : 2013071100Z

- Because the probability can't be accumulated. To present the uncertainty of the forecast, the technology combining the **QPFP** and the idea of **ETQPF** may be developed in the future.

# Summary

- *This study uses Taiwan cooperative precipitation ensemble forecast experiment (TAPEX) data to **analyze the probabilistic quantitative precipitation forecast (PQPF) and the probabilistic verification.***
- ***Four methods of verification**, including the reliability diagram (**RD**), relative operating characteristic (**RC**), Brier score (**BrS**), and ranked probability score (**RPS**), are used to verify the probabilistic rainfall forecast.*
- *The PQPF of the **typhoon with smaller radius** during 2011–2014 is usually **overestimated for high probability value.***
- ***The averaged error of PQPF for the northward typhoon is larger than the westward typhoon**, because the track uncertainty of the northward typhoon is more significant.*
- *The main future study challenges in this ensemble system are the significant underestimation of the **remote rainfall** and the **consistent ensemble tracks shifting.***

# Summary

- This study uses Taiwan cooperative precipitation ensemble forecast experiment (TAPEX) data to **analyze the probabilistic quantitative precipitation forecast (PQPF) and the probabilistic verification.**
- **Four methods of verification**, including the reliability diagram (**RD**), relative operating characteristic (**ROC**), Brier score (**BrS**), and ranked probability score (**RPS**), are used to verify the probabilistic rainfall forecast.
- The PQPF of the **typhoon with smaller radius** during 2011–2014 is usually **overestimated for high probability value.**
- **The averaged error of PQPF for the northward typhoon is larger than the westward typhoon**, because the track uncertainty of the northward typhoon is more significant.
- The main future study challenges in this ensemble system are the significant underestimation of the **remote rainfall** and the **consistent ensemble tracks shifting.**

~The End~

Thank you for your attention!

# Verification Results

- Analysis of different typhoon intensity
  - strong : Cat 3, Cat 4, and Cat 5
  - weak : TS, Cat 1, and Cat 2
- The performance is no significant difference between the strong typhoons and the weak typhoons.
