**Central Weather Bureau**

# Radar DA in CWB

LETKF

Hybrid 3DEnVAR

Ensemble mean

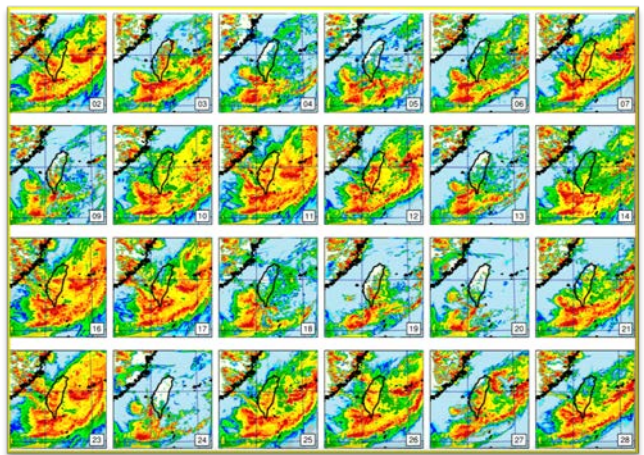

Be operational in 2016

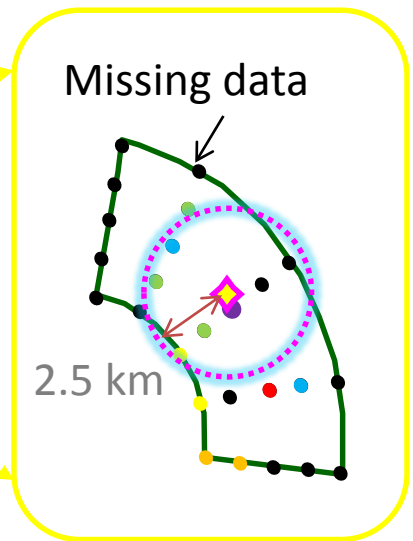

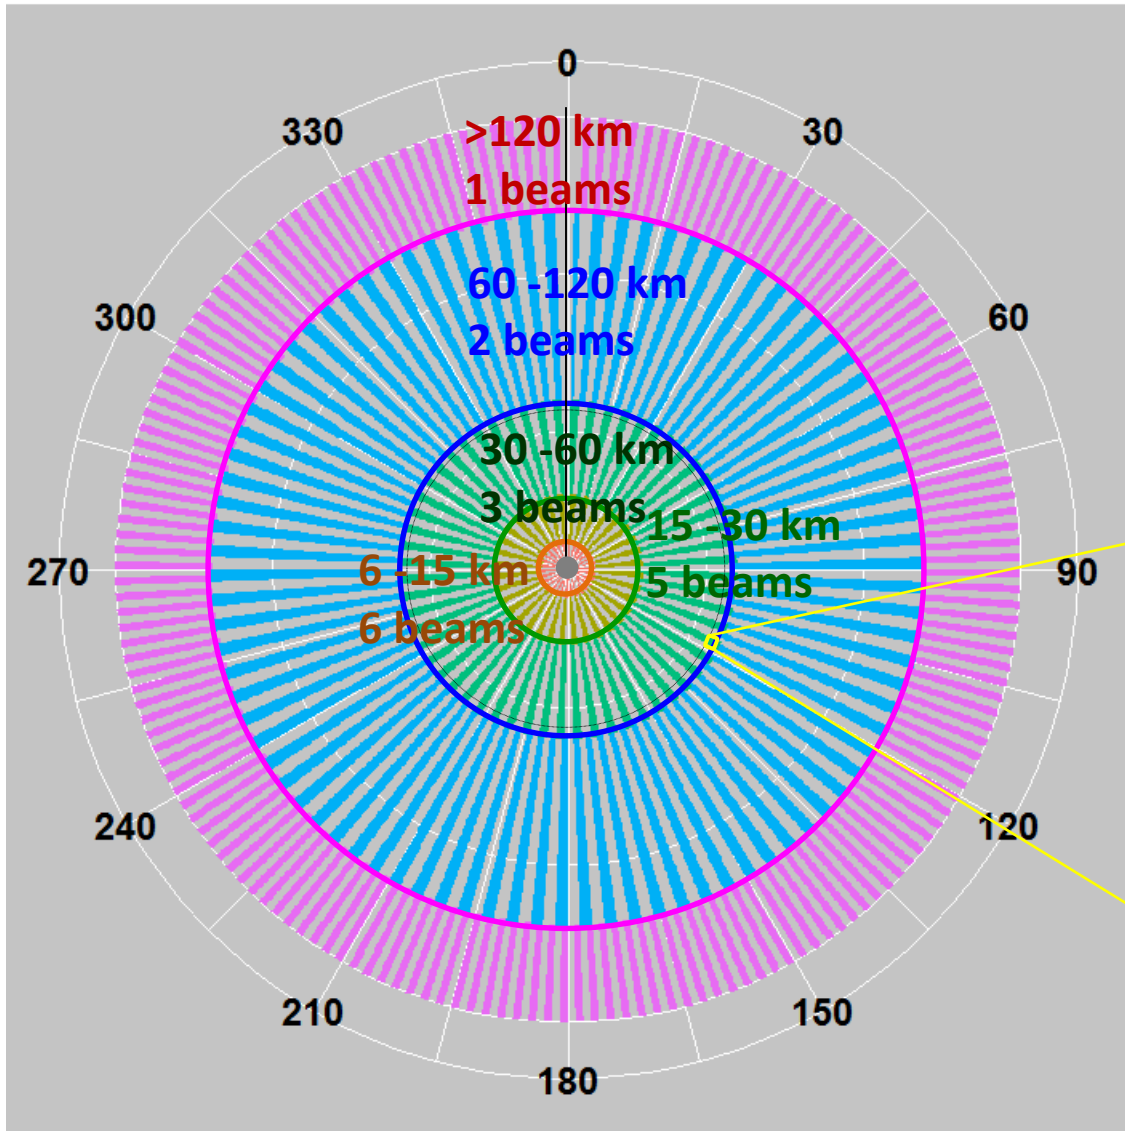

Realtime, hourly updated system extended to 12-hr forecast

Convective scale EPS

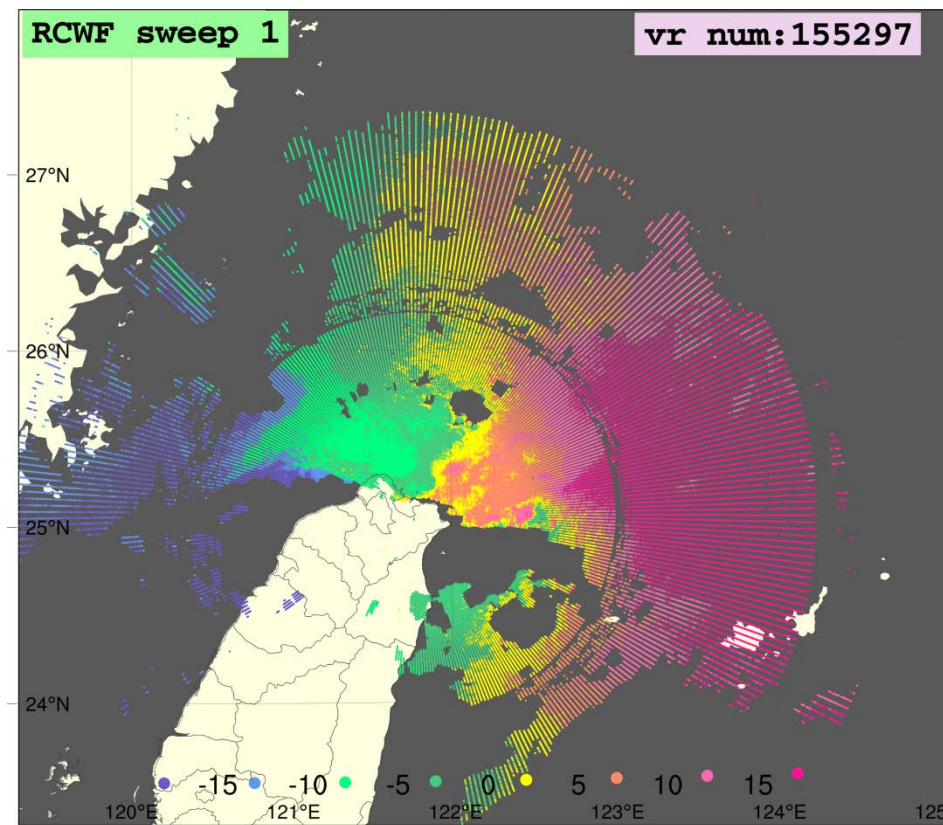

# Radar preprocess: Radial velocity

Thinning the radial winds along the azimuthal and radial direction at **PPI**  
Roughly comparable to the model (2-km)

# Radar preprocess: Radial velocity

Before thinning:  
Obs num: 155,297

After thinning  
Obs num: 14,628

# Radar preprocess: Reflectivity

multi-radar volume scans

3D mosaic CV

## Adaptive Barnes interpolation scheme (Askelson et al. 2000)

PPI (Plan Position Indicator) → CAPPI (constant altitude PPI)

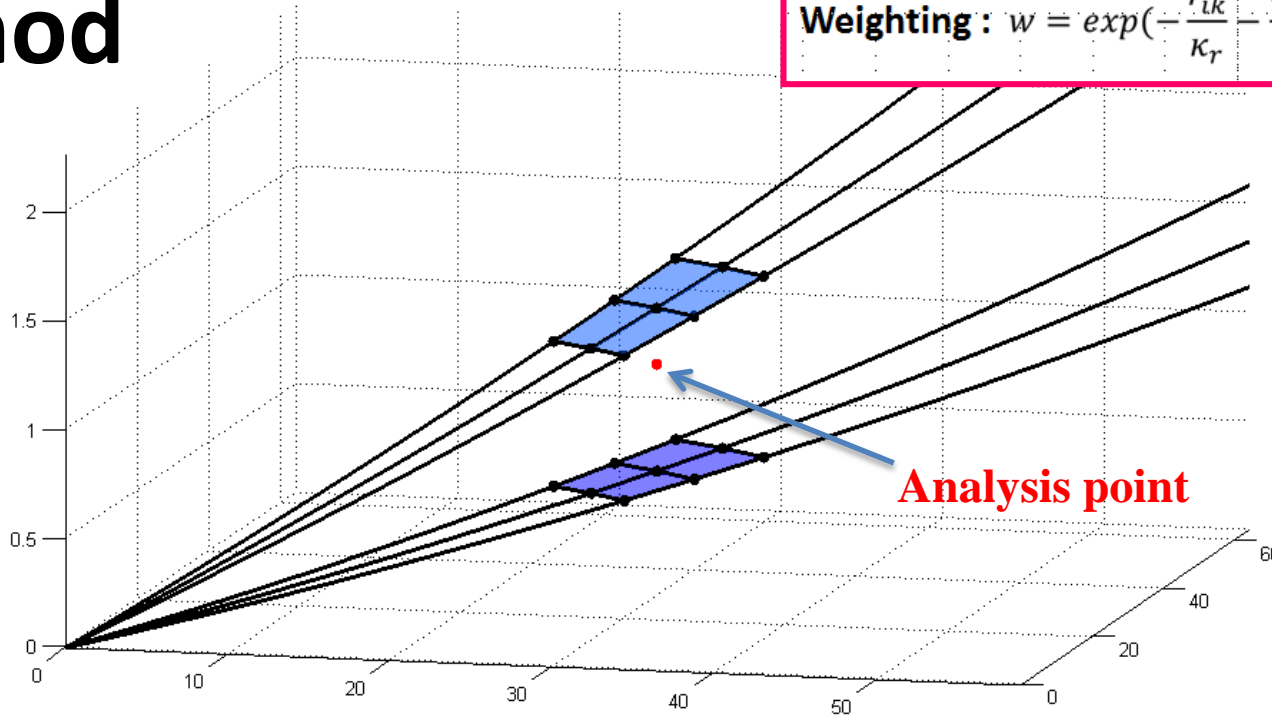

Thinning and compositing the multiple radar reflectivity to the 3D-MOSAIC at

- the model grid (2-km) in horizontal
- 250 m in the interval

## Method

$$\text{Barnes Method : } f_a(i) = \frac{\sum w(k) \cdot f_o(k)}{\sum w(k)}$$
$$\text{Weighting : } w = \exp\left(-\frac{r_{ik}^2}{\kappa_r} - \frac{\phi_{ik}^2}{\kappa_\phi} - \frac{\theta_{ik}^2}{\kappa_\theta}\right)$$

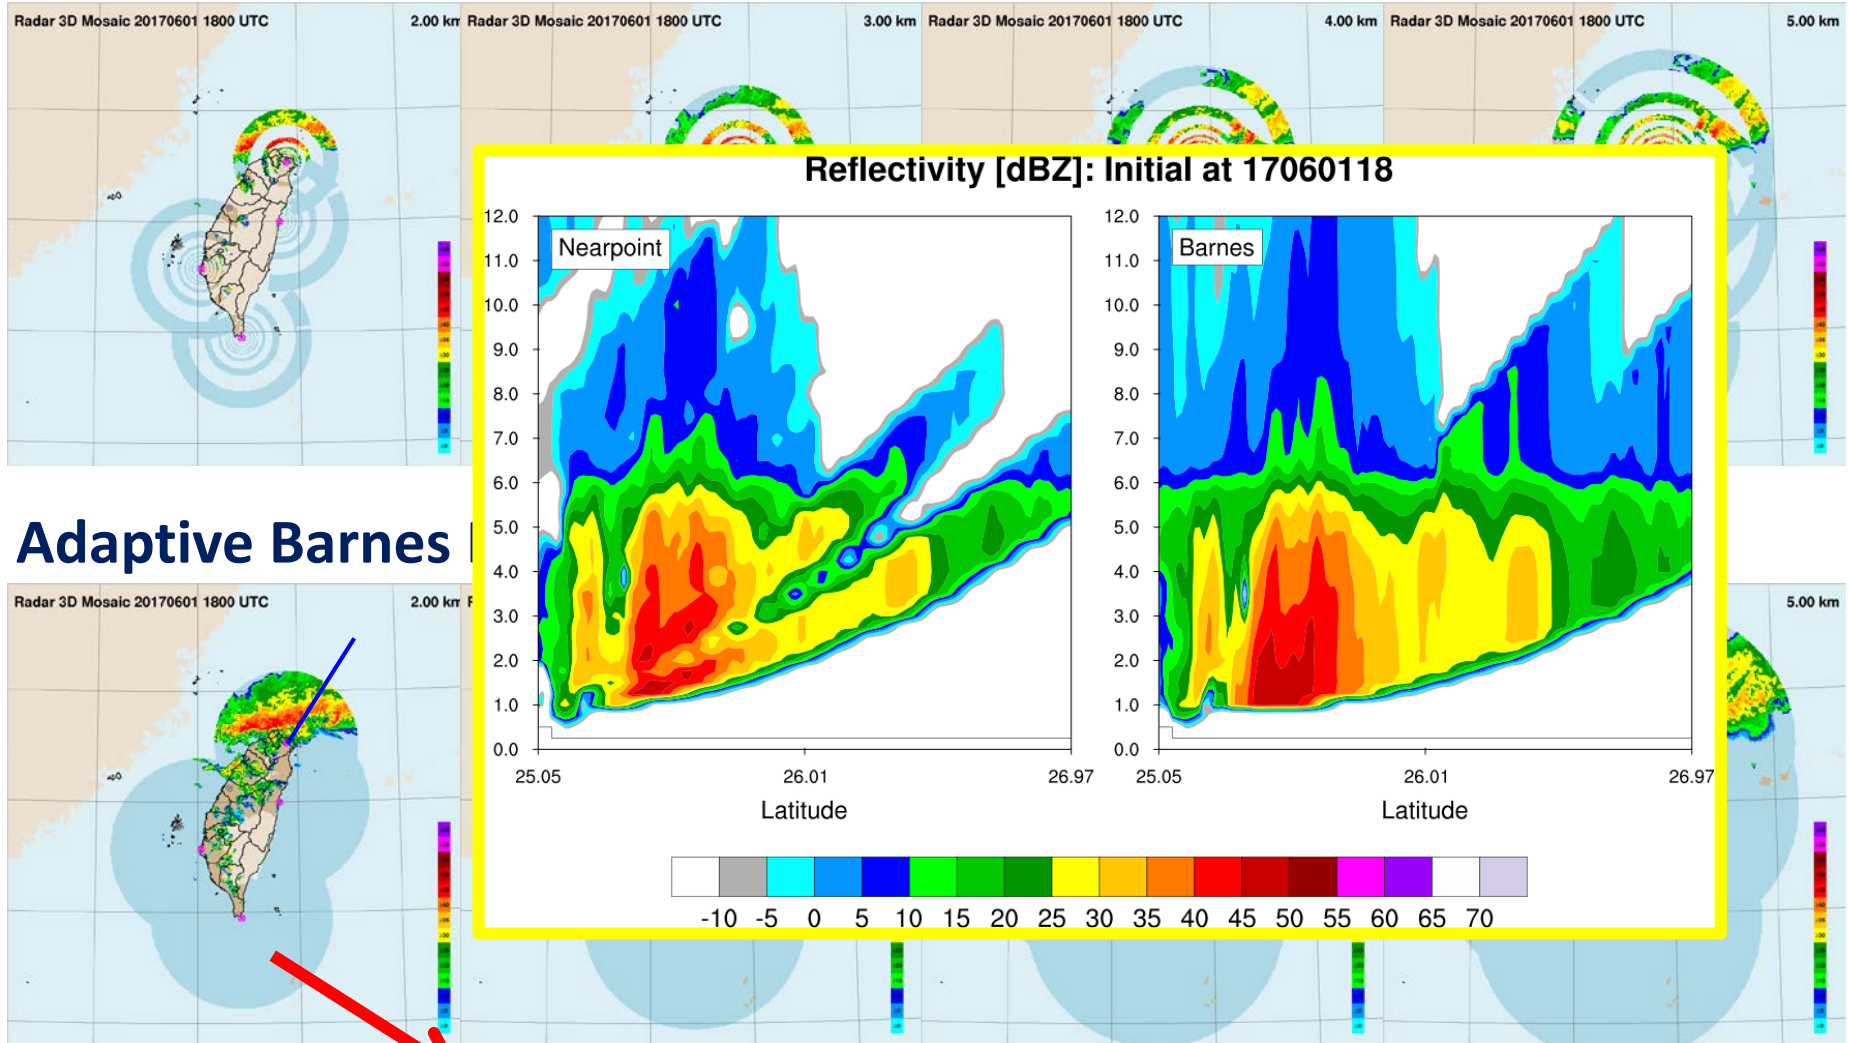

$\kappa_r = 0.336$
$\kappa_\phi = 0.336$
$\kappa_\theta = 0.336$

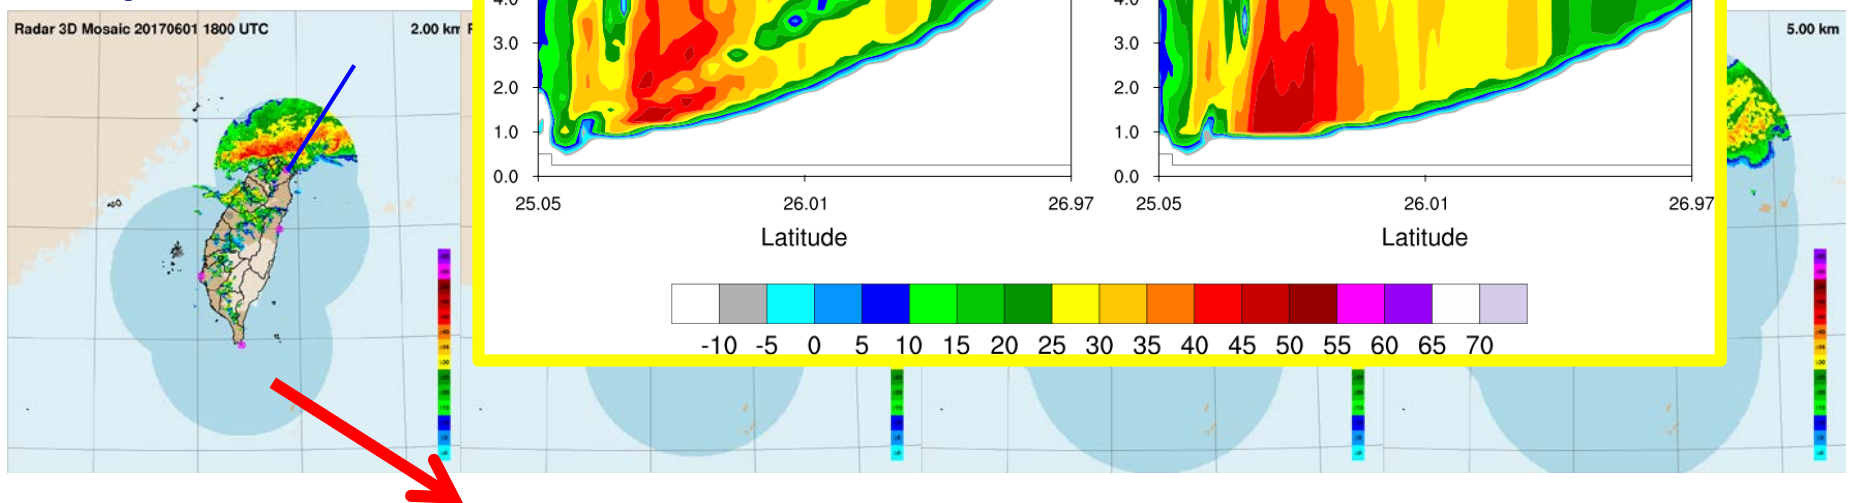

- Use the nearest **18** data points to interpolate to Cartesian grid.
- Missing value(not interpolate):
  1. Lower than  $0^\circ$  or higher than last elevation angle.
  2. Useful data are less than 6 (33%).

# Radar preprocess: Reflectivity

## Near point

## Adaptive Barnes

Use of the “No rain” observation

# Model configuration

grid points : 451\*451\*52  
Horizontal resolution : 2km

## Radar DA methods

**u/v momentum control variables** : cv\_options = 7 u-, v-wind, temperature, ps and pseudo relative humidity

**Microphysics control variables** : cloud\_cv\_options = 3 Wang et al., 2013a

BE of regular variables are from gen\_be; cloud variables hard coded

## Observation operators

$$V_r = u \sin \phi \cos \mu + v \cos \phi \sin \mu + w \sin \mu$$

$\mu$  is the elevation angle and  $\phi$  is the azimuth angle of radar beams

$$Z_e = \begin{cases} Z(q_r) & T_b > 5^\circ\text{C} \\ Z(q_s) + Z(q_h) & T_b < -5^\circ\text{C} \\ \alpha Z(q_r) + (1 - \alpha)[Z(q_s) + Z(q_h)] & -5^\circ\text{C} < T_b < 5^\circ\text{C} \end{cases}$$

$$Z_{dB} = 10 \log_{10} Z_e = 10 \log_{10} (Z(q_r) + Z(q_s) + Z(q_h))$$

$$Z(q_r) = 3.63 \times 10^9 (\rho q_r)^{1.75}$$

$$Z(q_s) = 9.80 \times 10^8 (\rho q_s)^{1.75}, T < 0^\circ\text{C}$$

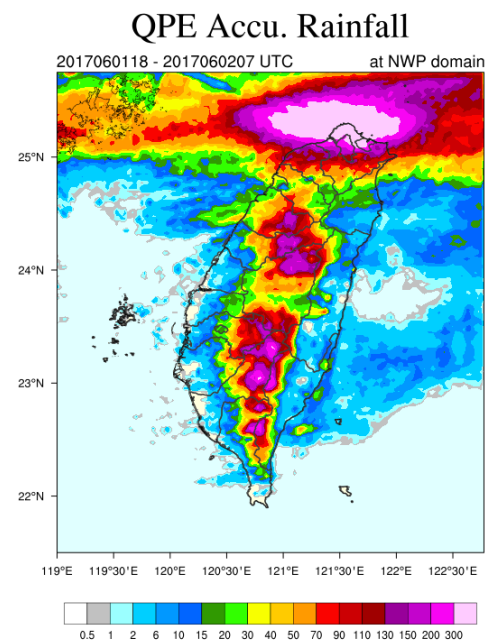

$$Z(q_s) = 4.26 \times 10^{11} (\rho q_s)^{1.75}, T > 0^\circ\text{C}$$

$$Z(q_h) = 4.33 \times 10^{10} (\rho q_h)^{1.75}$$

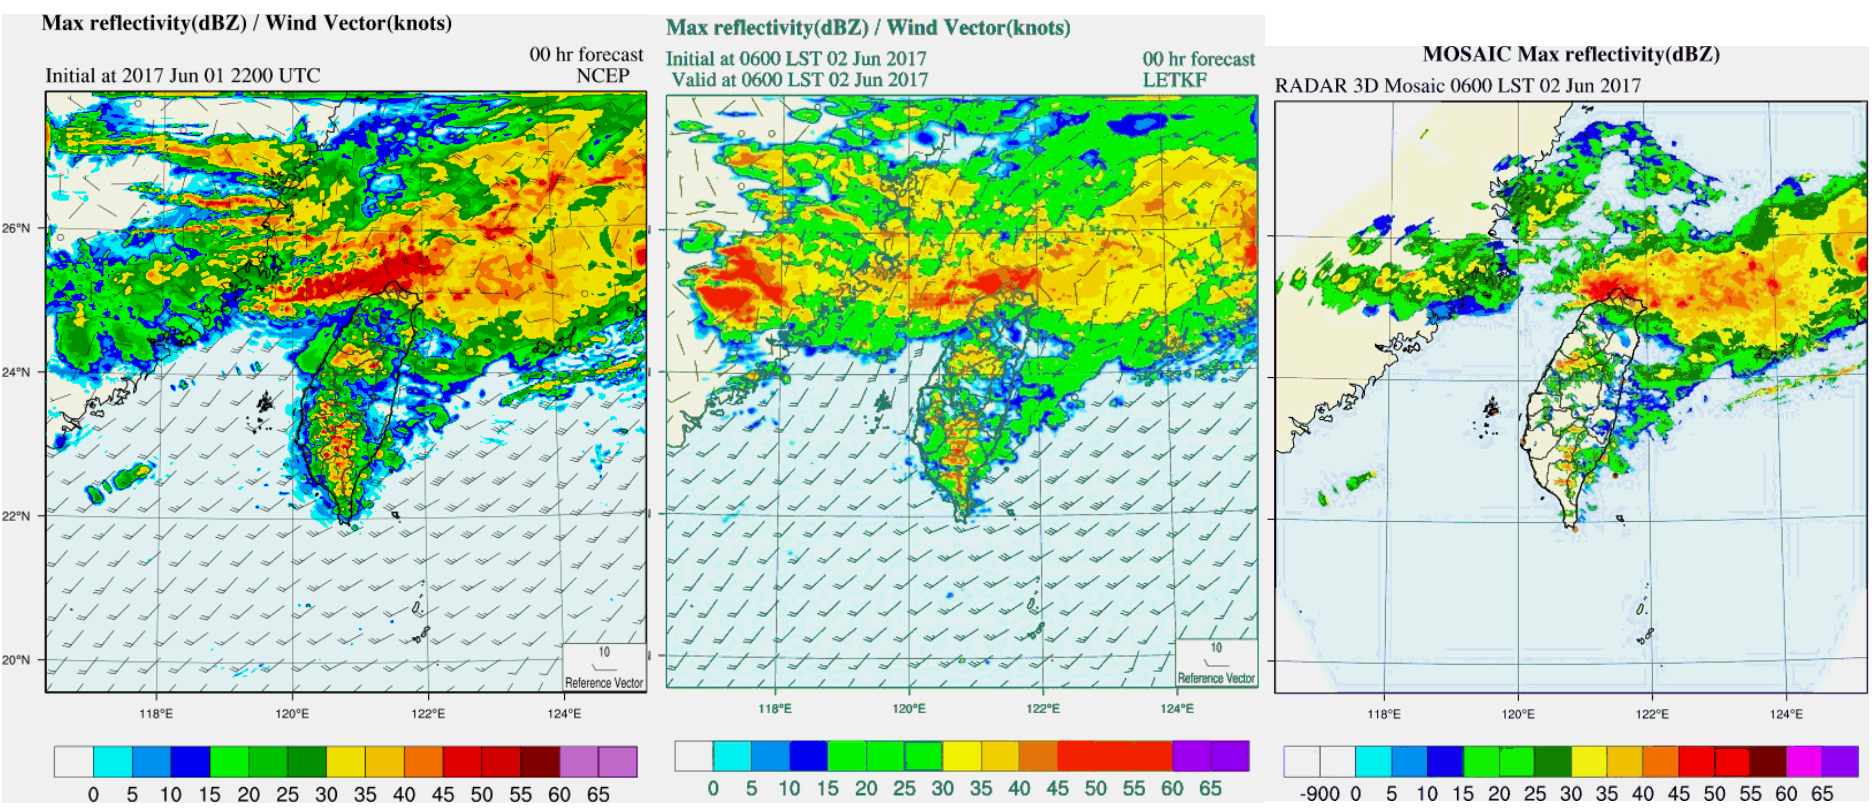

Gao and Stensrud (2012)

# Case 1 : Severe frontal rainband

□ Period : 170602 00 LST - 170602 15 LST

# Case 1 : Severe frontal rainband

3DVAR radar DA

LETKF radar DA

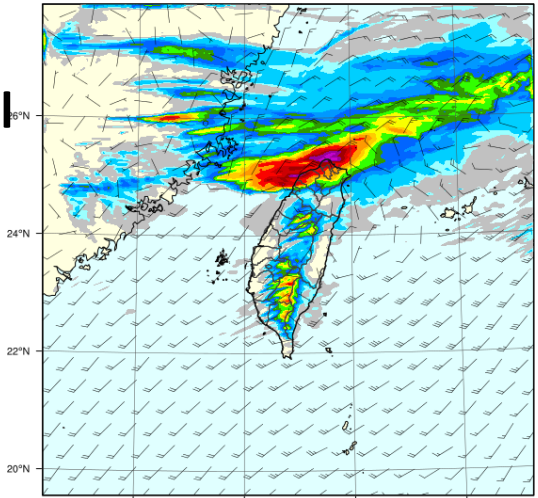

Observation

A slightly phase advance for the frontal position

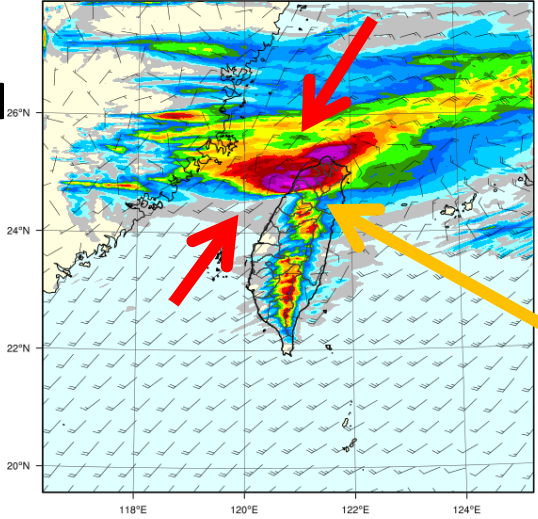

# Case 1 : Severe frontal rainband

# FSS SCORE

54 cases for the Mei-Yu frontal rainband system in early June 2017

# Summary

- **Two Radar Data Assimilation systems are functional in CWB**
  - 3DVAR system in operation
  - LETKF system in a realtime Testbed
- **LETKF system is slightly better than the 3DVAR system**
  - Hybrid 3DEnVAR is the next mileage to improve deterministic radar DA system
- **The Radar QC and Pre-process is critical for the success of the radar data assimilation**
  - More complete radar observation coverage is of most important
